

Post Body:

This is my docker-compose.yml:

My pom.xml looks like this:

I'm used to seeing Spring try to connect to a database before starting anything. I set up some temporary Repositories to make sure it had some Entities to work with.

• \_\_\_\_\_ - \_\_\_\_\_ / \ / \_\_\_\_\_ ' \_\_\_\_\_ ( ) \_\_\_\_\_ \ \ \ \ ( ( ) \ \_\_\_\_\_ | ' | ' | | ' \ \ ' | \ \ \ \

Accepted Answer:

To have a connection you just need to define the right properties in `application.properties`. To do a bit more you need to create at least one entity and call it.
